EDUCATION IMBALANCES IN THIRD WORLD COUNTRIES

ABSTRACT

Communities should be sampled at random and its members subjected to methods of research. Two main guiding questions are;

1. What is the relationship between the type of family a child is raised and the performance?

2. What fraction of students from public institutions score quality grades?

Survey of homesteads should be carried under both urban and rural conditions. The results are recorded and tabulated. The percentage of students in private institutions and in public institutions is recorded. And the ratio of performance included in the report. Entries of the findings should also be represented in a chart form for easy decoding of information recorded.

INTRODUCTION

The information collected is to be used to compare performance of students who get enrolled in private institutions and those in public institutions. This information could also reflect the impact of a student's background to his/her performance. During the research, random visit to homesteads is recommended because this to a larger extent represents a variety of conditions. Moreover students from different environments are Paid a visit i.e. urban setting and those from the rural setting. This is to determine the influence the environment has on an individual's performance.

PURPOSE OF THE PROJECT

Performance variations have been recorded between students who enroll in private institutions to those in public institutions. This project gives a problem solving approach to this tendency. From the findings of the study and research probable working solutions will be presented to the bodies responsible for the implementation for consideration.

SAMPLING METHOD:

All the house hold heads will be recorded, against the household map of the estate visited. This will assist in ensuring even allocation of visiting officers. The ratio of households visited to those listed in the map of the area will be recorded. The household state will also be recorded. It will be assumed that the information collected from the visited households represents the actual performance ratio of the area.

POSITION

In the research process, I will ensure the validity of data through field visitations and quality assurance by prove reading recorded information.

RESEARCH PROCESS

Visiting officers will be given estate maps to show direction. Tabulated forms will also be provided to ensure easy recording of data.

ORGANIZATION OF DATA

Data collected will be represented in graphs, pie charts and pictorial

representation.

EXPECTED PROBLEMS

Financial problems are expected as the exercise demands a lot of money to pay the visiting officers, transportation and data recording and analysis.

Few inaccuracies are also suspected as some household members may give false information leading to wrong conclusion.

The possibility of weather problems can not also be ruled out.

CONCLUSION

The research is expected to provide essential information that will be used to make informed decisions. Based on these decisions, the levels of education imbalances will be reduced and quality education for all ensured.
